A	CROSS
Y	TRIANGLE
LS (left stick click)	L3
RS (right stick click)	R3
START	OPTIONS
D-pad UP / DOWN / LEFT / RIGHT	D-pad UP / DOWN / LEFT / RIGHT

What this is

- TEMPO is the script. That's the main thing.
- GREEN is a side option. Backup.
- Only one runs at a time. Turn one on, other one turns off by itself.

First flash

- First boot wipes to defaults on purpose
- Don't tune before that or you lose it
- After that it saves every time you close the menu

Menu

- L2 + OPTIONS - open / close (saves on close)
- L2 + R2 - go into a section
- L2 + R1 - back out
- L2 + UP / DOWN - move
- L2 + LEFT / RIGHT - change value
- L2 + R2 + LEFT / RIGHT - change faster

Sections: GREEN, TEMPO, MOVE, DEF, SYS.

Leave the menu open, let go of L2, shoot. Hold L2 again to change the number. Never close it. Tune way faster.

TEMPO

Main system. Use this.

How it works

- Hold the button. Stick drops on its own.
- Watch the meter. Tick moves up.
- Let go ON the white line. Not before, not after.
- Script does the flick. Same speed every time.

You do the line. Script does the flick. That's the split.

Settings

- ENABLE - on turns GREEN off
- BUTTON - SQUARE or L1. Default L1. Set it to SQUARE, GREEN moves off it
- FLICK MS - stick travel speed. This is your tempo. Default 70
- HOLD MS - dwell at the top. Does nothing to tempo or timing. Leave 100
- FADE SPLIT - separate flick speed for left and right fades. Default off
- FLICK L MS - left fade flick. Default 70
- FLICK R MS - right fade flick. Default 70
- QUICKSTOP - on / off. Default off
- QS SETTLE - stop length. Default 260
- REMAP SQUARE - L3 or R3. Your real SQUARE goes here. Default L3

Tuning

- Tempo reads fast - raise FLICK MS
- Tempo reads slow - lower FLICK MS
- Timing reads late - let go earlier
- Timing reads early - let go later

Two problems. Two fixes. They don't cross.

Don't touch FLICK MS to fix timing. That's your tempo. You'll lose the wide window.

The white line

- Let go ON it
- Stick still travels after you let go, that's FLICK MS
- That travel carries it into the green
- Reading late every time? Let go a hair sooner. Same amount every rep, hands learn it quick

FADE SPLIT

Leave it off till your normal tempo is dialled.

- Turn it on if left fades feel different to right fades
- Then tune FLICK L and FLICK R on their own
- Both start at 70, same as your normal

GREEN

Side option. Not the main one.

Press the button, script holds it N ms, script lets go. Fully auto.

Read this

GREEN is impossible to make consistent.

- One fixed number per shot type
- The animation ain't fixed
- Jumpshot, court position, contest, range, fatigue all move it
- Zen sees none of it

Set shots from the same spot it's solid. Everything else it drifts.

How it picks

R2	Left stick	Uses
off	still	STAND MS
off	left	MOVE L MS
off	right	MOVE R MS
on	left	FADE L MS
on	right	FADE R MS

R2 has to be properly down and stick properly moving for a fade. Stops accidental fades coming off a dribble.

Settings

- ENABLE - on / off
- BUTTON - SQUARE or L1. Default SQUARE
- STAND MS - set shot. Default 600
- MOVE L / R MS - pull ups. Default 680
- FADE L / R MS - R2 fades. Default 740
- DEADZONE - how still counts as still. Default 20
- FATIGUE - OFF / LOW / MED / HIGH. Default OFF
- QUICKSTOP - on / off. Default off
- QS SETTLE - stop length. Default 260
- QS EXTRA - added on a quickstop shot. Default 40
- STEAL BTN - default L3
- DUNK BTN - default CIRCLE

Notes

- DEADZONE - stick drift? Raise it. Otherwise set shots read as pull ups
- FATIGUE - adds time if you been sprinting, wears off when you stop. Zen can't read your stamina bar, it's going off turbo. Feel thing. Start LOW
- STEAL / DUNK - GREEN eats your SQUARE so steal moves to L3. They can't land on your shoot button, script blocks it

Tuning

- One shot type at a time
- 10 of the same shot, read feedback
- Late = lower. Early = raise.
- Start with STAND MS, easiest to repeat

Side detection

Runs by itself. No setting to touch.

Problem it fixes: fading from the left corner your stick is pushed up toward the corner, not left. Driving straight up the floor is the same deal. Script had no idea which side you was on so it just guessed right every time.

Two ways it works your side out now.

- Any tilt decides it. Slight lean left is left, even if you mostly pushing up
- Dead straight up or down, it uses where you been moving the last few seconds

Where it applies:

- TEMPO fades
- GREEN fades - FADE L MS vs FADE R MS
- GREEN pull ups - MOVE L MS vs MOVE R MS

New in v3: pull ups. Before this, driving straight up the floor always took MOVE R MS even if you was going left. Left side pull ups was silently using the wrong number the whole time.

Standing still shots never touch this. STAND MS is checked first.

QUICKSTOP

Sprint into a shot.

- Press the button
- Script kills your stick and turbo
- You stop
- Then it shoots

Works with TEMPO or GREEN. Whichever you got on.

- Left stick locks the whole shot. That's what kills the spins and stepbacks
- No fades on a quickstop. You standing still by then. Correct, not a bug
- Shooting before you fully stop? Raise QS SETTLE

MOVE

- STAMINA - OFF / SOFT / RAMP. Default OFF
- GROUND % - how much. Default 85

Turns your stick down so you burn less.

- SOFT drops it straight away
- RAMP gives full speed first, then eases. First step stays explosive
- 85 you barely feel. 70 more help but slower

DEF

- CUTOFF - OFF / BOOST / MIRROR. Default OFF

Both modes only work while you holding L2 + R2. Normal defence untouched.

- BOOST - your right stick gets 30% stronger. Small flick reads as a full cutoff
- MIRROR - right stick copies your left stick. One thumb does movement and cutoffs

Try BOOST first. MIRROR is stronger but can reach and foul, since it feeds the right stick non stop.

SYS

- RUMBLE - default off
- STATIC - default off
- LED - light bar
- RESET - L2 + R2 to confirm

STATIC off is normal. Everything animates.

STATIC on freezes the idle screen. Shooting stars gone, footer stops scrolling, screen sits still. Menu still works normal.

Headset crackling

- That's the Zen, not the script. Headset in the controller pulls too much through it
- RUMBLE off, STATIC on. That's everything the script can do

Quick start

1. Flash it
2. Let it boot once, it resets itself
3. L2 + OPTIONS
4. TEMPO - ENABLE on, BUTTON SQUARE
5. FLICK MS 70 to start
6. Practice mode. Hold SQUARE, let go ON the white line
7. Tempo fast? Raise it. Slow? Lower it
8. Timing late? Let go sooner

Real

- Trash attributes and no badges? No script is greening that
- Your window comes from your build first
- Court position, contest and range move it too
- Zen sees none of it

This makes your good looks drop more. It don't turn a bad build into a shooter.
