SLEM

NBA 2K27 / Cronus Zen / v4.0 / tiktok/slem_2k / discord.gg/hsKWu8y3Ek

discord.gg/hsKWu8y3Ek

What this is

Four shooting modes. Only one runs at a time. Turn one on, the rest turn off by themselves.

- TEMPO - you time it, script does the flick. Main system
- QS TEMPO - same but stops you first
- GREEN - fully auto, script holds the button
- QS GREEN - same but stops you first

Every mode has its own numbers. Pick your mode, tune that section, never touch the others.

MOVE, DEF and SYS run alongside whatever you picked.

First flash

- First boot wipes to defaults on purpose
- Don't tune before that or you lose it
- Saves every time you close the menu

Menu

- LT + START - open / close (saves on close)
- LT + RT - go into a section
- LT + RB - back out
- LT + UP / DOWN - move
- LT + LEFT / RIGHT - change value
- LT + RT + LEFT / RIGHT - change faster

The top line scrolls the controls, so you never need this page open to navigate.

Sections: TEMPO, QS TEMPO, GREEN, QS GREEN, MOVE, DEF, SYS.

Leave the menu open, let go of LT, shoot. Hold LT again to change the number. Never close it. Tune way faster.

TEMPO

Main system. Default on.

How it works

- Hold the button. Stick drops on its own.
- Watch the meter. Tick moves up.
- Let go ON the white line. Not before, not after.
- Script does the flick. Same speed every rep.

You do the line. Script does the flick.

Settings

- ENABLE - on turns the other three modes off
- BUTTON - X or LB. Default X
- FLICK MS - stick travel speed. This is your tempo. Default 40
- HOLD MS - dwell at the top. Nothing to do with tempo or timing. Leave 150
- FADE SPLIT - separate flick speed left vs right. Default off
- FLICK L MS - left fade flick. Default 70
- FLICK R MS - right fade flick. Default 69
- SPOT BTN - catch and shoot button. Default RS
- SPOT MS - how long that shot holds. Default 700
- REMAP X - LS or RS. Your real X goes here. Default LS

Tuning

- Tempo reads fast - raise FLICK MS
- Tempo reads slow - lower FLICK MS
- Timing reads late - let go earlier
- Timing reads early - let go later

Two problems, two fixes, they don't cross.

Don't touch FLICK MS to fix timing. That's your tempo. You'll lose the wide window.

The white line

- Let go ON it
- Stick still travels after you let go, that's FLICK MS
- That travel carries it into the green
- Reading late every rep? Let go a hair sooner. Same amount every time, hands learn it quick

SPOT

Catch and shoot on its own button.

Press SPOT BTN and the shot fires straight away on SPOT MS. No timing, no stick.

For spot ups where you don't want to time anything. Your normal tempo button still works as always.

QS TEMPO

Tempo, but it stops you first.

- Press the button while sprinting
- Script kills your stick and turbo
- You stop
- Then the gather starts and you time it normal

Settings

- ENABLE - on turns the other three modes off
- BUTTON - X or LB. Default X

- FLICK MS - default 40
- HOLD MS - default 150
- SETTLE - how long the stop takes. Default 260

Own numbers. Tune them here. Don't touch the TEMPO section.

No fades on a quickstop. You standing still by then. Correct, not a bug.

Still shooting before you fully stop? Raise SETTLE.

GREEN

Fully auto. Press the button, script holds it N ms, script lets go.

Read this

GREEN is impossible to make perfectly consistent.

- Fixed number per shot type
- The animation ain't fixed
- Jumpshot, court position, contest, range, fatigue all move it
- Zen sees none of it

Set shots from the same spot it's solid. Everything else it drifts.

MODE - read before you tune

- SIMPLE (default) - two numbers. STAND MS for everything, FADE R MS for fades
- SMART - five numbers, picked off your stick

SIMPLE can't pick wrong because there's nothing to pick. That's why the simple scripts feel consistent.

SMART is better when it guesses right. When it guesses wrong you get a number you never tuned for that shot, and it feels random.

Start SIMPLE. Move to SMART only after STAND and FADE are dialled.

How SMART picks

RT	Left stick	Uses
off	still	STAND MS
off	left	MOVE L MS
off	right	MOVE R MS
on	left	FADE L MS
on	right	FADE R MS

RT has to be properly down and stick properly moving for a fade. Stops accidental fades off a dribble.

Settings

- ENABLE - on turns the other three modes off
- BUTTON - X or LB. Default X
- STAND MS - set shot. Default 700
- MOVE L / R MS - pull ups. Default 680
- FADE L / R MS - RT fades. Default 850

- DEADZONE - how still counts as still. Default 30
- FATIGUE - OFF / LOW / MED / HIGH. Default OFF
- STEAL BTN - default LS
- DUNK BTN - default B
- MODE - SIMPLE / SMART. Default SIMPLE

Notes

- DEADZONE - stick drift? Raise it. Otherwise set shots read as pull ups
- FATIGUE - adds time if you been sprinting, wears off when you stop. Zen can't read your stamina bar, it's going off turbo. Feel thing. Start LOW
- STEAL / DUNK - GREEN eats your X so steal moves to LS. They can't land on your shoot button, script blocks it

Tuning

- One shot type at a time
- 10 of the same shot, read feedback
- Late = lower. Early = raise.
- Start with STAND MS, easiest to repeat

QS GREEN

Auto green, but it stops you first.

- ENABLE - on turns the other three modes off
- BUTTON - X or LB. Default X
- STAND MS - default 740
- SETTLE - how long the stop takes. Default 260

Own number. One value, every shot. You just stopped so it's always a standing shot.

Tune it here. Don't touch the GREEN section.

Side detection

Runs by itself. No setting.

Fading from the left corner your stick points up at the corner, not left. Same driving up the floor. Script used to just guess right every time.

- Any tilt decides it. Slight lean left is left, even if you mostly pushing up
- Dead straight up or down, it uses where you been moving the last few seconds

Applies to TEMPO fades, GREEN fades, and GREEN pull ups. SMART mode only.

Standing still never touches this. STAND is checked first.

MOVE

- STAMINA - OFF / SAVER / MAX. Default OFF
- DRIBBLE - on / off. Default OFF
- DRIB SPD - dribble speed. Default 100

STAMINA

Turns your stick down so you burn less.

- SAVER - 85%. You barely feel it
- MAX - 70%. More help, you'll feel slower

Values are fixed. Nothing to tune.

DRIBBLE

Early phase. Works but not finished. Expect to tune it, expect it to get better in later versions.

Turn it on and the d-pad runs moves:

D-pad	Move
UP	Curry Cross
LEFT	Crab Stepback, left
RIGHT	Crab Stepback, right
DOWN	nothing, stays normal

Hold to loop. Let go and it stops right there - it don't finish the move first.

DRIB SPD is your one knob.

- Moves not coming out? Raise it
- Moves clipping or chaining bad? Lower it
- 100 is the starting point

Heads up: with DRIBBLE on, up / left / right stop reaching the game, so play calling and icon passing on those directions are gone. Down still works normal.

DEF

- CUTOFF - OFF / BOOST / MIRROR. Default OFF

Both modes only while you holding LT + RT. Normal defence untouched.

- BOOST - right stick gets 30% stronger. Small flick reads as a full cutoff
- MIRROR - right stick copies your left stick. One thumb does movement and cutoffs

Try BOOST first. MIRROR is stronger but can reach and foul, it feeds the right stick non stop.

SYS

- LOADOUT - THEATRE / PARK / ANTE UP. Default THEATRE
- LATENCY - global offset. Default 0
- RUMBLE - default off
- STATIC - default off
- LED - light bar
- RESET - LT + RT to confirm

LOADOUT

Three saved setups. Switch and it saves what you had, then loads the other one. You never lose a tune.

Each one remembers your MS values for every mode.

Buttons and toggles are shared on purpose. Those are your setup, not your tuning.

LATENCY

One number, shifts every shot in every mode at once.

Laggy TV or wireless and everything reads late? Drop it a bit instead of retuning each value.

STATIC

Off is normal, everything animates.

On freezes the idle screen. Shooting stars gone, footer stops scrolling. Menu still works normal.

Headset crackling

- That's the Zen, not the script. Headset in the controller pulls too much through it
- RUMBLE off, STATIC on. That's everything the script can do

Quick start

1. Flash it
2. Let it boot once, it resets itself
3. LT + START
4. TEMPO is already on with X
5. FLICK MS 40 to start
6. Practice mode. Hold X, let go ON the white line
7. Tempo fast? Raise it. Slow? Lower it
8. Timing late? Let go sooner

Want it fully auto instead: GREEN ENABLE on, leave MODE on SIMPLE, tune STAND MS.

Want it to stop you first: use QS TEMPO or QS GREEN and tune those sections.

Real

- Trash attributes and no badges? No script is greening that
- Your window comes from your build first
- Court position, contest and range move it too
- Zen sees none of it

This makes your good looks drop more. It don't turn a bad build into a shooter.
