SLEM CV on PC - step by step

discord.gg/slem

What this is

A PC program. NBA 2K runs on this same PC (Steam). SLEM watches the game window on your screen, reads the shot meter, and lets go of the shot button for you at the right moment. No console, no stream, no capture card.

Read this first. On PC the app runs on the same computer as the game. NBA 2K's anti-cheat can see programs on your PC, and a PC account can be banned or suspended directly, with no console in between. SLEM does nothing to the game: it only looks at your screen and plays your controller for you, but nobody can promise that this is never detected. Use at your own risk. No ban guarantee, no 100% green guarantee, and results depend on your PC and your setup.

Do the steps in order. One step at a time. Do not skip.

Which controller

SLEM has to hide your real controller from the game and hand the game its own controller instead. That works for:

- a PlayStation controller (DualSense or DualShock 4), USB or Bluetooth: best choice
- an Xbox controller on Bluetooth

It does NOT work for an Xbox controller on a USB cable: Windows drives a wired Xbox pad as XInput and it cannot be hidden from the game, so the game would see both pads and your own hand on the button. Setup says "a wired Xbox controller cannot be hidden from the game: use it on Bluetooth or use a PlayStation controller". No Cronus Zen and no Titan Two in the chain: the controller goes straight to the PC.

PART 1 - Install (only once)

Step 1. Install ViGEmBus. Go to github.com/nefarius/ViGEmBus/releases, download the newest .exe, run it, Next, Next, Finish.

Step 2. Install HidHide 1.5.230. Go to github.com/nefarius/HidHide/releases, download HidHide_1.5.230_x64.exe, run it. Your PC will restart. That is normal. After the restart, do NOT open HidHide and do not change anything in it. SLEM controls it.

Step 3. If you have DS4Windows or DSX on the PC: uninstall them. They break this.

Step 4. Steam: Library > right-click NBA 2K > Properties > Controller > set it to Disable Steam Input. Steam itself stays open, the game needs it.

Step 5. Windows: turn Game Bar off (Settings > Gaming > Game Bar). HDR off (Settings > System > Display): it looks duller, that is not lower quality, the meter is found by its colours and HDR shifts them.

PART 2 - Game settings (only once)

Step 6. In 2K, Settings > Video Settings (or Display): Display Mode = Borderless or Windowed. Not Fullscreen. In Fullscreen SLEM sees a black picture.

Step 7. In 2K, Settings > Controller Settings:

Setting	Set it to
Shot meter	ON
Shot meter type	Arrow 2
Shot meter size	Large
Shot meter position	To the side of the player
Shot feedback	All shots (the TIMING box must show after every shot)

Close the game after that. SLEM starts before the game (Part 4).

PART 3 - SLEM, first time

Step 8. Unzip the SLEM folder anywhere. Open SLEM Scripts.exe. Windows says "protected your PC"? More info > Run anyway.

Step 9. Press Log in with Discord. Your browser opens Discord, press Authorize, then This is my PC. The page shows a 6-letter code; the app shows the same code. Back in the app your name is in the top bar.

Step 10. Top right: press the console button until it says PC mode. A red card opens: PC mode: extra risk. Read it. The button counts down 10 seconds, then press I take full responsibility.

Step 11. The Setup window opens. Go through every step, top to bottom, until each is green. In the controller step plug the controller in (PlayStation controller by USB, or an Xbox controller on Bluetooth) and press Find my controller. In the NBA 2K on this PC step start the game (Borderless or Windowed) and press Check again. The Test step only watches: shoot 10 shots yourself and let go on your own timing. Press Next when it is done.

HidHide step red with "untick Inverse application cloak"? Another program set HidHide up its own way. Open HidHide Configuration Client > Applications, untick Inverse application cloak, press Check again.

PART 4 - Every session (the order matters)

Step 12. Game closed. Controller off (or unplugged). DS4Windows and DSX closed.

Step 13. Open SLEM, check it says PC mode top right, press Start, read the red card, press I agree.

Step 14. Turn the controller on when SLEM asks. The log must say real pad on SDL and controller hidden from other apps.

Step 15. Now start NBA 2K (Borderless or Windowed, on the main monitor). Offline MyCOURT first. SLEM's window minimises itself when it goes live and comes back on Stop: that is normal.

Step 16. The red chip replug the controller. If SLEM shows it (log: "controller: unplug it and plug it back in (the game still holds it)"), the game or Steam opened the controller before SLEM hid it. SLEM does not go live until you do this: unplug the controller, wait two seconds, plug it back in (Bluetooth: turn it off and on). The log says "controller: back, hidden from the game" and the chip turns to LIVE.

Step 17. Hold the shot button and keep holding it (X, or Square on a PlayStation controller). SLEM lets go for you. Do not tap: if the panel says "you let go first: N of last 10", you released before SLEM did. Everything else is normal.

Step 18. Happy with the timing? Press Lock aims next to the aims. The badge reads LOCKED, learning stops, and the set / fade numbers become boxes you can type into (Enter applies, 80 to 400 ms). The lock is saved per book and survives a restart. Press it again to let SLEM learn again.

Step 19. Done: press Stop in SLEM. That gives your controller back to Windows.

First session: expect a few early or late shots while it learns your setup. Give it 10 to 15 shots.

Problems

What you see	What to do
SLEM says the picture is black, or "set Display Mode to Borderless or Windowed"	The game is in exclusive Fullscreen. Change Display Mode in 2K (Step 6) and restart the game
SLEM does not find the controller	Steam Input is still on for the game (Step 4), or DS4Windows / DSX is running. Fix it, Stop, Start again
"a wired Xbox controller cannot be hidden from the game"	Put the Xbox controller on Bluetooth, or use a PlayStation controller (see Which controller)
Red chip replug the controller / "the game still sees your controller: unplug and replug it"	Step 16: unplug, two seconds, plug in. While playing it means three fired shots in a row were not seen by the game; learning pauses until the next shot the game accepts
Red controller unplugged: plug it back in	The controller dropped. Plug it in, SLEM says "controller back" and carries on
Two controllers in the game, or the game ignores your controller	SLEM was started AFTER the controller was on. Stop SLEM, controller off, Step 13 and 14 again, then the game
"aim moved 20 ms this run: press Reset aims if shots feel off"	Learning moved the aim as far as it may in one run. Press Reset aims, or Lock aims at a value you trust
SLEM refuses to start	DS4Windows or DSX is still open. Check the tray icons bottom right
Controller does nothing in other games after	Open SLEM Scripts once and close it. That un-hides it
Setup says "game window not found"	Start NBA 2K, un-minimize it, press Check again. The Steam window and the 2K launcher do not count as the game
Setup says a Cronus Zen / Titan Two is in the chain	Unplug it. The controller goes straight to the PC

To switch USB <-> Bluetooth: Stop in SLEM, switch, Start again.

- This is a test release. It can be inconsistent or not work on your setup. Do not open a ticket for it.
- Post in #cv-feedback what happened, and press Send issue in the app: it sends the log to us by itself. Write one line about what you saw; an empty report is filled with the last status line.
